- XmlMethodAuthorizingRealm

## Anonymous Access

These fields are used to authenticate anonymous requests. When a request comes in without credentials, Nexus uses the Anonymous Username and Anonymous Password field as a substitute and pass it through the security subsystem. This is used in conjunction with third party security realm integration. For example if you were authenticating against Active Directory, the username might be "Guest" instead of anonymous. If you are using the default Nexus security realm, then these shouldn't be changed.
